DETAILED ACTION

Double Patenting

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 33-45 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1-20 of U.S. Patent No. 6,743,646 B2. Although the conflicting claims are not identical, they are not patentably distinct from each other because both include a method of designing underlying structures in a wafer that balances planarization and optical metrology characteristics including fabrication underlying structures of varying size and/or shape, comparing planarization characteristics of the underlying layers of the wafer to standard planarization characteristics, fabricating target structures in the target layer of the wafer, measuring a reflected metrology signal off a target structure fabricated above a calibration test area to obtain a calibration metrology signal, the calibration test area having an unpatterned underlying structure; selecting an underlying structure design

from the plurality of underlying structure that yields a reflected metrology signal off the target structure above a patterned area that is closest to the calibration metrology signal, the selected underlying structure having planarized layers that meet the preset standard planarization characteristics. Examiner notes that for claims 44-45, the various pad shapes of 646 may produce the damascene and dual damascene structures.
